DETAILED ACTION

Allowable Subject Matter

Claims 1-4 and 40-47 are allowable over prior art of record.

The following is an examiner's statement of reasons for allowance: prior art does not teach: "In a computer system having a control knob and a display screen, a method comprising the steps of: detecting a physical presence proximate to or in contact with the control knob for a predefined period in which the control knob is stationary; and displaying a display widget on the display screen responsive to said step of detecting, the display widget providing status information associated with the control knob.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 5, 16, 18-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Murai et al. (US Pat. No. 5,635,958).

In regard to claims 5, 16, 18-20 Murai et al. teach in a computer system having a control switch and a display screen, a method comprising the steps of detecting a physical presence proximate to or contacting the control switch for a first predefined period in which the control switch maintains a current switch state; and displaying a display widget on the display screen responsive to step of detecting (see Figs 4-9), the display widget providing status information

Art Unit: 2674

associated with the control switch (see the abstract). Furthermore, a plurality of thumb proximity sensors are disposed at a lower position of the surface of a key group (keyboard) so that one of the thumb proximity sensors is designated by detecting approach or contact of the thumb, while, one of the keys in the key group is designated by other four fingers, whereby the designation of one of the thumb proximity sensors and that of one of the keys in the key group is combined together to perform a key operation, thereby entering information which all function as claimed.

Claims 6-15, 17, 21-39 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
